FOR IMMEDIATE RELEASE

Introducing Shot Data: The shot list database creation application crafted for Final Cut Pro

[Singapore, 20th October 2026] – Today, we are delighted to unveil Shot Data, a shot list database creation application from the creator of Marker Data and Production Data, crafted for Final Cut Pro users seeking a straightforward, native way to turn a pre-cut stills timeline into an ordered Shot List Database.

Shot Data streamlines the way professionals translate Final Cut Pro still-image timelines into polished, shareable shot lists, allowing directors, cinematographers, and producers alike to generate one PNG per shot into a Notion Database.

Its use cases span pre-cut shot lists from storyboard stills, Shot List Databases assembled before the shoot, director and cinematographer shooting-sequence visualisation, scene-locked stills timelines in Final Cut Pro, sound-locked timelines for picture and audio alignment, and collaborative Notion databases for locked pre-shoot intention, among others.

Core Features:

- **Native macOS Workflow:** A graphical interface for Shot Extraction, so directors and producers need not use the Terminal or a command-line upload tool.
- **Shot List Extraction:** Shot Data extracts still images from the primary timeline in Final Cut Pro, writing one PNG per shot together with a structured shot list manifest.
- **Notion Database Upload:** When a Database Profile is selected, Shot Data uploads the shot list to Notion in-process, merging by Shot ID and attaching each still as a page image.
- **Notion Queue:** Extract first and batch upload later. Notion Queue lists Notion shot-list folders so destinations can be assigned and uploads run in sequence.
- **Notion and CSV Manifests:** Extract as a Notion JSON manifest designed for the Shot Data Notion Template, or as a standards-compliant CSV for spreadsheets and custom pipelines.
- **Database Profiles:** Store a Notion Integration Token and Database URL for each destination.
- **Scene Number and Folder Format:** Control shot IDs and export folder naming, with a quick Scene Number badge on Extract.
- **Multiple Configurations:** Create and switch between multiple configurations tailored to diverse project requirements, each with assignable keyboard shortcuts.
- **Drag and Drop Support:** Accepts drag and drop of .fcpxml and .fcpxmld files, as well as Final Cut Pro timeline drags, with extraction beginning as soon as a valid timeline is received.
- **Organised Export Output:** Each extract is saved to a uniquely named, timestamped folder within your chosen export destination.
- **No Hidden Costs:** No subscriptions, no in-app purchases, and no recurring fees attached to continued use.

Shot Data is available now on the Mac App Store for USD $59.99, and requires macOS 26.0 or later, Final Cut Pro 12.0 or later, and runs exclusively on Apple silicon Macs.

Shot Data is now available for download at https://shotdata.theacharya.co.

About The Acharya

The Acharya is an independent production company based in Singapore founded by Vigneswaran Rajkumar. Its current relentless pursuit is to develop and produce feature films for a distinctive global audience. With an unequivocal focus on Asian Cinema, it is engaged to bridge production opportunities and collaboration of various artistic disciplines in Asian and International landscape.
